

Magnetic Insect Screens

Magnetic Insect Screens are almost invisible when placed on your window, as the charcoal mesh absorbs the light energy and minimizes the light reflection and glare. This makes our Magnetic Insect Screens very aesthetic and doesn't restrict your view. The mesh is plastic coated, non-flammable, reinforced nylon fibreglass, making the screen very strong and durable.

The Magnetic screen adheres to the perimeter of the fixed window frame on the inside of the window and can be left in place all year. They are held in place by our unique Magnetic Sealing System.

The screens are very flexible, due to the magnetic snapback action, which allows for easy opening and closing of your window. There are other Fly Screen options available click the link to see the range.
